Maintenance/Calibration packages and SIM device exchange

Data logger maintenance

The data logger maintenance package includes the following:

- ▶ Firmware check/update (TESTdrive, FPGA, PIC, modem/WiFi module)
- ▶ Component diagnosis (e.g. functional test of memory cards, condition of the BIOS battery, etc.)
- ▶ System tests under specified ambient temperature conditions

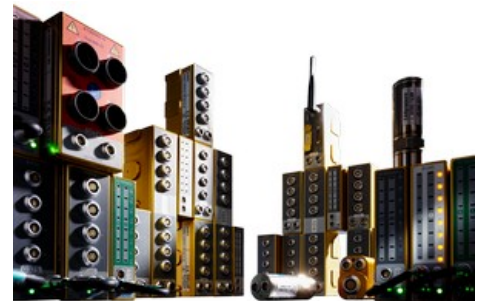

Device maintenance/calibration

In order to guarantee the reliability of your measurement results, IPETRONIK recommends the calibration of all measurement and testing equipment on a regular basis and offers different maintenance packages:

Basic package

- ▶ Measurement accuracy check at various measurement points at room temperature (23 °C)
- ▶ Firmware update
- ▶ Documentation of the results
- ▶ Inspection tag for the maintained device

Premium package

- ▶ Calibration at various measurement points within the specified ambient temperature range
- ▶ Adjustment of the respective input channels in case of a tolerance violation
- ▶ Calibration date update for the IPEmotion calibration alert
- ▶ Firmware update
- ▶ Check of additional functions, such as sensor voltage supply, filter functions, etc.
- ▶ Documentation of the results
- ▶ Inspection tag for the calibrated device

SIM device exchange "new for old"

Since the transition time for the discontinued SIM device series expired, those measurement modules will no longer be maintained. Without an annual calibration, the reliability cannot be guaranteed.

Do you still have SIM devices in use?

If you buy new IPEmeasure M2 or X series hardware, you can return your old SIM devices to IPETRONIK and we will grant you a discount!

If you have any questions about our maintenance packages or the SIM device exchange, our sales team will be glad to assist you.
